Features and specifications are subject to change without notice

1. TECHNICAL SPECIFICATIONS**PRINTING**

Method: Direct Thermal
 Resolution: 8 dots/mm, 640 dots/line
 Print width: 80 mm
 Print speed: up to 150 mm/s
 X/Y positioning of texts and bar codes
 Texts and bar codes printed in four orthogonal directions
 Lines, boxes, shadow and reverse printing
 Graphic and logos: bit image mode
 Bar Codes: EAN8, EAN13, 2/5, 2/5 I, 3/9, 2/7, DUN-14/16, UPC-A, UPC-B, UPC-E, CODE 128, EAN 128

Automatic Check Digit computation
 Wide/narrow ratio full programmable
 Half, standard and double density
 Height programmable
 Suppression of human readable characters

Batch printing: up to 9999 labels
 Layouts: 26 programmable in EEPROM, 100 fields each

Up to 10 protection levels for variable data printing
 4 up/down 16 digits counters
 Real Time Clock

Black intensity adjustable via software
 Print button for last label repeating

INTERFACING SIGNALS

Three optoisolated I/O

DATA TRANSFER INTERFACE

RS232 : serial parameters settable by dip switches

RS485 : on request

HANDSHAKE PROTOCOL

SW : XON/XOFF

HW : DTR

DATA TRANSMISSION

ASCII format

CHARACTER GENERATORS

Micro	(fixed matrix)	5x5
Standard	(fixed matrix)	7x5
Draft matrix	(fixed matrix)	8x13
Big matrix	(proportional)	32

New Century	(proportional)	45
Title	(fixed matrix)	88x88
Compact	(proportional)	19
Olaf	(fixed matrix)	32x48
Century	(proportional)	31
Arial	(proportional)	49
Bookman	(proportional)	63
Magnifications		9 x 9

CHARACTER SIZES

0.65 x 0.65 mm minimum

105.30 x 105.30 mm max.

PERMANENT MEMORY

32K bytes, 20 years data retention

DETECTOR

End of paper and feeding synchronism

PRINT MEDIA

Die cut labels

LABEL SIZES

Width: 30 mm min., 90 mm max.

Length: 272 mm max.

Key: width min.: 2 mm
 depth min.: 25 mm starting
 from the inner edge

ROLL SIZES

Width: 30 mm min., 90 mm max.

Outer diameter: 250 mm max.

Core diameter: 45 mm min.

PRINTER DIMENSIONS

See following pictures

Weights: 8 Kg (printer)
 7 Kg (electronic cabinet)

POWER REQUIREMENTS

Voltage: 115/230/240 Vac; 50-60 Hz

on request 110 Vac

ENVIRONMENT

Operating temperature: 0°/ 40° C

Storage temperature: -20°/60° C

Humidity: 10% - 95% non-condensing

OPTIONS

Label taken sensor

ETIK, wysiwyg label editor Windows based

2. UNPACKING

Open the box and check the content :

- **italora** label printer model **BH 80**
- Electronic Control Unit cabinet
- connection cables
- unwind holder and flanges

- power cable
- roll of labels
- printing tests
- CD Rom with manuals and Etik Light

3. GENERAL VIEW

PICTURE 5

5. INCOMING INSPECTION

- * Assemble the label unwind holder support and flanges as shown in picture 6, using provided two screws and two spacers.
- * Proceed with label and ribbon loading, see chapter 7.
- * Connect the Printer Mechanism to the Electronic Control Unit using the two provided cables.
- * Check the correct pinout of the serial Cannon 25 pins female connector and connect the printer to the computer .
- * For further details see chapter 8 "Interfacing".
- * Check the voltage on the name plate next to the power receptacle.
- * Connect the power cable to a grounded power line
- * Switch the main switch on (rear panel)
RED and GREEN leds ON mean operating conditions.
- * Push the PRINT BUTTON, you will get a printing test with the EPROM release information.
- * Sending data from the computer you will get the first printing.
- * Push the PRINT BUTTON to get the last printing again; the printer keeps the information of the last printing until next data arrive.

NOTE: Printer retains the label length and the baking paper transparency in permanent memory. In case of change of print media see the following paragraph.

PICTURE 6

5.1. LABEL FORMAT SET UP PROCEDURE (SEE PICTURE 5)

The printer retains the label length and the backing paper transparency in permanent memory.

If changing label format or print media type you have to use the following procedure to update the values (see also paragraph 7.2):

- 1 - Switch the printer off.
- 2 - Lift the printing head up by rotating lever #25b.
- 3 - Thread the web between the printing roller and the printing head #21,105.
- 4 - Lift the pressure roller up by rotating lever #17b.
- 5 - Thread the web between the driving roller and the pressure roller #35,32 up to the rewinding shaft #102.
- 6 - Check web has been rightly positioned under the label photosensor #10.
- 7 - Lift the printing head and the pressure roller down by rotating levers #25a and #17a.
- 8 - Switch the printer on while pushing the print button.
- 9 - Printer ejects some labels (depending on their length) and stores the values of the media.
- 10 - Release the print button.
- 11 - The green led lit and the printer is ready to work.

6. PRINTING MEDIA DESCRIPTION

White coated glossy printing paper

- weight: 65 ÷ 90 g/mq (ISO536)
- caliper: 0,075 ÷ 0,083 mm (ISO534)

ADHESIVE SPECIFICATIONS

- peel adhesion(90° C): 430 N/m
- service temperature: -20° C ÷ + 70° C

LINER SPECIFICATIONS

- BG 40 brown, supercalendered glassine
- weight: 65g/mq (ISO536)

- caliper: 0.057 mm (ISO534)

- transparency: 45%

SUGGESTED MODELS

- Fasson Fasthermal NT
- Kanzaki KPT 86-H

LABEL DIMENSIONS See Chapter 1

STORAGE

Keep labels and ribbons in a dry place at temperature not over 40° C and not exposed to direct sun light.

7. LABEL ROLL REPLACEMENT (SEE PICTURE 5)

In case of changing of label format or printing media type, remember to follow the "Label format set up procedure" shown on paragraph 5.1.

Remove the movable flange by rotating the lever #41.

Remove the empty label roll.

Insert new label roll onto roller #45

Reassemble the movable flange and push it tightly against the side of the label roll; lock lever #41.

By rotating the lever #25b, lift the printing head #105 from the feed roller #21, setting the movement of labels free.

By rotating the lever #17b, lift the pressure roller #32 from the driving roller #35.

Remove clip #28 from the rewinding shaft #102.

Remove backing paper from the rewinding shaft.

Remove the first 50 centimetres from liner of the new roll labels.

Hold pressure clip #33 up and feed the liner through the path, thread the web between the printing roller and the thermal head #21,105, then around the driving roller and under the pressure roller #35,32, finally slide the liner on the rewinder unit #102 and fasten it with the clip holder #28.

Turn the rewinder to stretch the paper.

Turn head lever and toggle lever back to closed positions #25a,17a.

Check paper has been rightly positioned under

the label photosensor #10.

Check pressure clip #33 has been positioned between centre and outer side of the label.

WARNING: Italora OEM printer mechanisms must operate only in peel-off mode with backing paper rewound by toggle lever rollers. Any other print mode (strip form, tear-off, etc.) is not allowable and cause an incorrect paper feeding and bad printout quality.

8. INTERFACING

8.1. SERIAL INTERFACE

Electronic Control Units 80.160.00xx for **BH80** printer mechanisms have a RS232 hardware interface (RS485 on request). Provided on board connector is a Cannon 25 pins "DB" female cabled as shown in the following pictures.

COMPUTER CONNECTOR WITH 9 PINS

COMPUTER CONNECTOR:
 -using sw protocol XON/XOFF:
 short together PINS 7-8 and 1-4-6.
 -using hw protocol DTR:
 short together PINS 1-4-6.

COMPUTER CONNECTOR WITH 25 PIN

COMPUTER CONNECTOR:
 -using sw protocol XON/XOFF:
 short together PINS 4-5 and 6-8-20.
 -using hw protocol DTR:
 short together PINS 6-8-20.

8.2. I/O SIGNALS

Electronic Control Units 80.160.00xx are provided of three optoisolated lines for I/O signals: one input and two outputs. A six pins DIN connector type GPE/DIN 40040 is present cabled as follows.

- 1) + START PRINT (INPUT)
- 2) - START PRINT (INPUT)
- 3) + ALLARM (OUTPUT)
- 4) - ALLARM (OUTPUT)
- 5) + PRINT END (OUTPUT)
- 6) - PRINT END (OUTPUT)

(FRONT EXTERNAL VIEW)

PRINT END output signal is a 250 milliseconds active pulse (optotransistor in conduction) when printer has finished to eject a printed label. This signal is commonly used to get one of our printers interfaced with automatic systems, such as appliers. It can be programmed in two different ways with the "?66&" software command (see "**PROGRAMMING MANUAL**"):

* "?66&0" standard behaviour: a pulse of 250 msec is driven as soon as the feeding of a label has been completed. In these 250 msec (optotransistor in conduction state) the signal goes from the high level (4.4V) to the low level (0.8 V).

In this case the delay between a label and its next is, obviously, at least 250 msec.

* "?66&1": the pulse is driven (optotransistor in conduction state) during the whole label feeding so, in this period, the signal goes low.

The electronic circuit is like this:

ALARM output (OUTAUX) signal is a level output becoming active (optotransistor in conduction) when printer detects an alarm condition: it remains active until alarm condition is present.

In end of paper or end of ribbon condition, together with the traditional led blinking, this auxiliary signal goes low and it stays there until you put the printer well again.

With your software you can program this signal in two different ways (see “**PROGRAMMING MANUAL**”):

* *disabled signal* (default): the signal level is always high (4.4 V).

* *enabled signal*: you can choose this possibility with the “?64&” software command; the signal goes low for the next 250 msec after the command decoding.

The electronic circuit is like this:

START PRINT input signal is activated by Set Up menu. For more information see “**PROGRAMMING MANUAL**”.

Meaning of START PRINT input is “print enable”: printer will not print any label, as after an Host computer command or as after a Print Button pushing, until START PRINT is active for at least 50 milliseconds. For every ejected label a 50 milliseconds minimum active pulse is required. Otherwise, after a pulse on this input, the printer will print only if a previous print or batch command was received, or a Print Button pushing was executed.

8.3. DIP SWITCHES FACTORY SETTING

Referring to pictures 1 and 21, dip switches factory setting for Electronic Control Unit 80.160.00xx is shown in following table (rear view, from left to right). For more details see also “**PROGRAMMING MANUAL**”.

1	2	3	4	5	6	7	8	1	2	3	4	5	6	7	8
-	-	OFF	OFF	-	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF
ON	ON	-	-	ON	-	-	-	-	-	-	-	-	-	-	-

9. MAINTENANCE

WHEN NOT IN USE:

- SWITCH OFF POWER
- ALWAYS LIFT UP THE PRINthead AND THE TOGGLE LEVER MECHANISM

9.1. CLEANING

Print Head

- Turn the power off.
- Wait until thermal head cools down.
- Lift the print head by using the lever on position 25c
- Remove labels.
- Moisten a cotton cloth with denatured alcohol.
- Polish the below side to remove incidental adhesive traces or parts of labels
- Wait until dry before use

WARNING: never use hard tools as this may damage the print head.

Rubber feeding roll: use alcoholic detergents.

Photosensor: use a soft brush.

Metallic and plastic parts: use a soft cloth with water-based detergent (weak).

Removing adhesive traces or parts of labels: use alcoholic detergents. Be careful the liquid does not drip on the electronic compartment.

10. TROUBLE SHOOTING

10.1. NO LABELS FEEDING

Four situations may occur.

a) RED led is OFF, check (pict.1,#100):

- main voltage
- main switch (pict.1,#103) ON.
- main connector (pict.1,#104) plugged in
- main fuses (pict.1,#6) intact.

b) RED led is ON, STATUS led is BLINKING GREEN,

check:

- label roll is not used up.
- paper position under the photosensor (pict.5,#10)
- c) RED led is ON, STATUS led is BLINKING YELLOW:
 - head temperature control active, printer stops until temperature has fallen to normal values.

10.2. INCORRECT LABEL ALIGNMENT

Make sure that:

- print head is closed (pict.5,#25a)
- toggle lever is closed (pict.5,#17a)
- paper position under the photosensor (pict.5,#10)
- backing paper is correctly rewound (pict.5,#102)
- pressure clip (pict.5,#33) is positioned

- between centre and outer side of the label.
- movable flange is tightly pushed against the side of the label roll with the lever (pic.5,#41) in lock position.

See also "Label format set up procedure" paragraph 5.1

10.3. PAPER SLIDES TO RIGHT SIDE

Check whether:

- pressure clip (pict.5,#33) is positioned between centre and outer side of the label.

- movable flange is closely positioned against the side of the label roll with the lever (pic.5,#41) in lock position.

10.4. PRINTING WITH PATCHES MISSING

Check whether:

- thermal print head needs cleaning (chapter 9) .

10.5. BLANK LABELS

Check whether

- the fuse (8AT) on the back panel has blown

- the print head connector is correctly plugged in (pict.13,#112) with polarity key up.

10.6. POOR PRINTING CONTRAST

- See Electronic Control Unit rear panel.

- turn the print head screw (pict.1,#106) for temperature fine adjustment :

clockwise to make print darker.
anticlockwise to make print lighter.
Otherwise use the software command ?77& (see Programming Manual).

BEWARE: continual high operating temperature of thermal head may reduce its working life .

11. HARDWARE NOTES

11.1. HOW TO CHECK ELECTRONIC BOARDS

- **First unplug the power cable from the electronic cabinet.**
 - turn the 4 front and the 4 rear screws out (pict.8a#114 - 121).
 - remove front and rear panels.
 - turn the 4 side screws out (pict.8a,#122 - 125).
 - turn the 3 inner screws out (pict.8b,#126 - 128).
 - Unplug the following connectors from CPU board (pict.21).and pull carefully off the electronic boards from the chassis
- Y3 = leds and push button
- Y4 = stepping motor
Y5 = label photosensor
Y7 = serial interface
Y9 = thermal head
Y10 = power supply
Y14 = fan
- disconnect the ground cable turning the chassis nut out
 - unplug the fuses connectors and the main switch connector.

11.2. PRINT HEAD PROTECTION FUSE REPLACEMENT

- Thermal print head is protected by an 8 A timed fuse (pict.1,#9).

11.3. THERMAL PRINT HEAD REPLACEMENT

(SEE PICTURE 27)

- 1 switch the printer off .
- 2 unplug the flat connector #112 from the print head.
- 3 lift print head by rotating the lever #25c.
- 4 turn the screw #130 out.
- 5 remove the adjusting nut #18.
- 6 pull out the print head and dissipater assembly from the pivot pin.
- 7 turn the screw #138 out and remove the print head #26 from the dissipater.
- 8 replace thermal head and run back steps 7 to 2.

WARNING: pay attention to plug in correctly the thermal head connector, wrong connection causes irreversible damage to the print head functionality (pict. 13)

- 9 in case of printing quality problems, loosen the screw #130 and turn slowly the adjusting nut in or out #18, for the best printing quality, finally lock the screw #130.

11.4. DRIVE BELT REPLACEMENT

(SEE PICTURE 29)

Loosen the relevant idler #16 to remove belt #34, #36 or #38. Replace the belt and stretch it by the idler till

you get a deflection of 3 mm when applying a force of 6 N.
